

WEED CONTROL FOR NEWLY SPRIGGED BERMUDAGRASS

Vanessa Corriher-Olson, Larry Redmon, and Paul Baumann Extension Forage Specialist, Overton; Extension Forage Specialist and Extension Weed Specialist, College Station

One of the many challenges producers face when establishing a new stand of bermudagrass is initial weed pressure. Prior to land preparation for establishment of sprigs, it is important to eradicate any unwanted vegetation. Annual weeds may be controlled by thorough tillage; however, perennial weeds should be sprayed with a nonsoil active herbicide such as glyphosate (Roundup) several weeks prior to tillage. This will allow re-treatment of any weed escapes prior to establishing bermudagrass. Any soil disturbance by plowing or disking promotes germination of weed seed. The use of a preemergence herbicide (applied prior to weed emergence) is one of the best defenses against early season competition with the newly established sprigs. Diuron and 2,4-D + dicamba products are labeled for application immediately after sprigging and can provide effective pre-emergence residual control (Table 1). However, be sure to check the label to ensure your product is labeled for pre-emergent application. Post-emergent herbicide treatments may still be necessary after sprig establishment. Newly established sprigs are more sensitive to herbicides than established stands of bermudagrass, therefore, you should observe treatment timings recommended in Table 2 to avoid injury. Herbicide selection, rate, and growing conditions are critical in preventing injury to sprigs. Always read and follow label instructions for any herbicide/pesticide/insecticide.

The label is the law.

Herbicide	Rate/Acre Broadcast	
Direx 4L (diuron)	0.8-2.4 quart/acre	
Comments: Apply Direx immediately after sprigging and rolling to control annual broadleaves and grasses (up to 4" in height). For control of emerged annual weeds up to 4 inches in height, apply 0.4 to 0.8 quarts per acre. Bermudagrass sprigs should be planted 2-3 inches deep to minimize damage. Emerged bermudagrass at the time of treatment may be temporarily injured. Direx is not labeled for use in established bermudagrass hayfields and pastures.		
Weedmaster (2,4-D & Dicamba)	2 to 4 pints/acre	
Comments: Best re	sults will be obtained if Weedmaster is applied 7 to 10 days after ontrol can be expected if weeds are allowed to reach 1" in height	

Table 1. Pre-Emergent Herbicides

Table 2. Post-Emergent Herbicides	
Herbicide	Rate/Acre Broadcast
Outrider	1.33 oz/acre
(Sulfosulfuron)	
nutsedge, and oth bermudagrass. Ad up application of	ly Outrider at 1.33 oz/ac to control johnsongrass, yellow and purple her weeds four weeks after the emergence of the newly established ddition of non-ionic surfactant at 1-qt/100 gallons is required. A follow- Outrider can be made when sufficient weed regrowth is observed, but bur weeks after the previous application.
2,4-D amine/ester	1.0-2.0 quart/acre
amine formulatio per acre per seaso	ly 2,4-D to emerged broadleaf weeds 3-4 inches tall. Use non-volatile ns from late March through September. Do not apply more than 2.0 qt on. Do not make more than two applications per year. Minimum interval al applications is 30 days.
PasturAll (2,4-D & Aminopyralid)	1.5- 2 pints/acre
Comments: Past	urAll should be applied only after perennial grasses are well established a good secondary root system and show good vigor).
Surmount	
(Picloram &	1.5-6.0 pints/acre
Fluroxypyr)	
	ly at 1.5 pt/acre to sprigged bermudagrass once stolons (runners) have s in length and growing conditions are favorable.
